

One home for every celebration

Locked project requirements | Version 1.0 | September 13, 2026

This document consolidates the requirements approved in the project conversation and the saved implementation plan. It is the target product specification, not a claim that all functionality has been delivered.

Product decision

Continue building Utsava. Evolve the existing application into a general celebration planner for individuals, families, academies, companies and communities. Preserve useful existing features and records while replacing academy-only assumptions with optional modules.

Product promise

Help people organize their next celebration with less effort: a short setup, understandable navigation, shared responsibilities, flexible templates and plans they can reuse. Broad household adoption and competitive differentiation are ambitions, not guarantees of market exclusivity or zero defects.

Contents	Page
Account structure, ownership and roles	2
Organized user workflows	3
Event templates and customization	4
People, vendors and preparation details	5
Planning modules, payments and subscriptions	6
Navigation, visual design and usability	7
Technical architecture and migration	8
Acceptance criteria, delivery status and open decisions	9

Scope boundaries

The software must support any number of events per space. Company participation and personal hosting coexist under one login. Billing prices, storage limits and detailed commercial entitlements have not been locked. Stripe is the selected subscription payment provider.

Accounts, ownership and access

ACC-01 Use one identity/login across multiple independent spaces: Personal, Family and Company/Academy. A person can belong to multiple organizations and retain their own family space.

ACC-02 Each event belongs to exactly one owning space. Space membership and event-specific participation define access. Invitations do not transfer event ownership or reveal a member's other spaces.

ACC-03 A parent in a company event may also be a teacher elsewhere, a guest in another event and a host in their own family space. Parent, teacher and host are contextual roles, not mutually exclusive account types.

ACC-04 Company admins manage all authorized company records and functions. They do not automatically see personal or family events. Platform support access is separate and audited.

ACC-05 A parent may buy a personal/family hosting plan without changing company permissions. Invited company participation must not require that personal purchase. Leaving a company must not remove personal events.

Role	Target scope
Space owner	Memberships, space settings, subscription and events in that space.
Company administrator	Company events, staff, student/parent/teacher assignments and organization records.
Event host/cohost	Manage the particular event and its collaborators.
Teacher/coordinator	Assigned participants, schedules, rehearsals and tasks.
Parent/guardian	Explicitly linked children and permitted event responsibilities.
Student/participant	Permitted personal schedule and tasks; profile can exist without a login.
Vendor / guest	Only explicitly shared service or guest-facing information.

ACC-06 Invitation acceptance connects an existing identity rather than creating duplicate accounts. Revoked or view-only members cannot edit. Guardian links and family membership require explicit association; do not infer them from names or email domains.

User workflows

Company onboarding and participation

1. Create company space and appoint its owner/admin.

Next

2. Add student/participant profiles; invite teachers, parents and coordinators.

Next

3. Recipients sign in or complete onboarding and explicitly accept access.

Next

4. Create events and assign people, responsibilities and relevant permissions.

Parent becomes a personal host

1. Participate in the company event using the same login.

Next

2. Choose Create my own event and select/create a personal or family space.

Next

3. Choose an occasion, name a draft and customize the suggested plan.

Next

4. Upgrade the family space when paid hosting features are needed. Company access stays separate.

Event lifecycle

Choose occasion > Name draft > Personalize > Invite and assign > Track preparations > Event-day checklist > Photos and thank-yous > Archive or reuse.

Guest and vendor journeys

Guest: restricted invitation > household RSVP > permitted event details. A guest should not need an app installation or planner access.

Vendor: requirements > compare options > family selects > booking confirmed > delivery tracked > payment recorded. Selection alone does not confirm a booking.

Templates for every occasion

TMP-01 Provide the occasion starters below and a blank start. Templates configure one shared event system; they are not separate applications.

Occasion	Relevant starting content
Birthday	Guests, cake, food, activities, gifts and photos.
Wedding	Multiple functions, household RSVP, seating, ceremonies, vendors and outfits.
Graduation	Honorees, invitations, program, catering and photography.
Halloween	Theme, costumes, treats, activities and potluck.
Thanksgiving	Meal contributions, dietary needs and seating.
Christmas	Gathering schedule, food and optional gift exchange.
Diwali	Food, decor, optional ceremonies and performances.
Arangetram	Students, gurus, rehearsals, program, costumes, jewellery, makeup and orchestra.
Get-together	Date planning/poll, invitations and food contributions.
Company celebration	Teams, coordinators, approvals, budget, registration and vendors.

TMP-02 Template content includes suggested tasks, relative deadlines, budget categories, service categories, applicable forms, invitation theme and optional modules. It must not insert real/example personal data or assume a booked vendor.

TMP-03 Users can remove sections, add custom fields, rename relevant labels and save reusable personal templates. Store a versioned event snapshot; later template changes must not overwrite customizations.

TMP-04 Show student/guru/training fields only when relevant. A birthday must not require them. Support one parent event with multiple functions, each with its own time, venue, guest selection and schedule.

TMP-05 On date changes, propose changes to relative deadlines while preserving explicitly fixed deadlines. Reuse structures safely; do not silently copy prior guests, payments, private documents, measurements or vendor commitments.

People, vendors and preparation

PPL-01 Maintain student/participant profiles independently of login accounts. Support multiple children per parent, explicit guardian permissions and teacher assignment, including adding a new teacher.

PPL-02 Keep identity details, training, family relationships, season/event assignments and account access understandable. Collect only fields relevant to the current step and action.

VEN-01 Maintain vendor profiles, service categories, contacts, availability, quotations and event assignments. Offer multiple providers for every service and an option to use the family's own vendor. Families choose the provider they prefer; company admins manage company arrangements.

VEN-02 Keep shortlisted, selected, confirmed, delivered/completed and paid states distinct. Compare prices, availability and service details without implying that a preference is a contract or payment.

Service	Required capability; individual values optional until needed
Tailoring / dress	Structured measurement form with units (inches/centimeters), dress color, fabric, design details/reference attachments, fitting dates, delivery dates and notes.
Jewellery	Design references and details for short haram, long haram, bangles, hair set, waist belt and earrings; support additional components and rental/purchase, collection and return details.
Makeup	Overall look/colors; pancake or foundation brand and shade; lipstick, eyeliner, eyeshadow, blush, hair/flowers, product preferences, appointment details and reference designs.
Other services	Catering/menu/headcount/dietary needs; photography coverage and deliverables; venue, decor, audio, orchestra and custom service requirements.

VEN-03 Allow independent vendors for tailoring, jewellery and makeup. Preserve requirements per participant/event when applicable. Private measurements, files and contacts must only be shared with explicitly authorized recipients.

VEN-04 Provide usable preparation sheets for coordination, including print/export where applicable. Saving requirements does not automatically complete a fitting, confirm a booking, send an invitation or transfer money.

Core planning and payments

MOD-01 Overview: show what needs attention, what happens next, who is responsible and what is waiting for confirmation. Summaries must use real records, not demo values.

MOD-02 Guests: household invitations and RSVP, guest counts, dietary needs, appropriate guest visibility, seating and event-day check-in when enabled.

MOD-03 Plan: tasks, owners/contributors, deadlines, schedule, dependencies and event-day checklist. Support reminders and announcements with reliable delivery status.

MOD-04 Budget: planned, committed and paid amounts; expenses, obligations, invoices, contributions, approvals and reports as relevant. Preserve currency clarity and payment status.

MOD-05 Files: design references, preparation documents and private attachments with controlled access. Optional food contributions, seating, functions, rehearsals and ticketing appear only when enabled.

MOD-06 Preserve the useful academy modules: seasons, events, timeline/tasks, students, vendors, guests, budget/payments, reports, user management, access control and profile/settings. Imports, exports, draft resumption and reports must work accurately when offered.

Three separate money flows

Payment	Purpose and ownership
Utsava subscription	Software capabilities for the purchasing personal/family/company space. Stripe selected.
Organizer/event fee	Participation fee or contribution paid to the event organizer.
Vendor payment	Money associated with a particular booked service.

BIL-01 Buying a family subscription must not grant extra company permissions. Paying an academy fee must not be mistaken for purchasing a software subscription.

BIL-02 Activate entitlements only after verified provider confirmation. Handle duplicate/retried webhooks, payment failures, renewal and cancellation. Cancellation must not delete existing event data.

BIL-03 Personal/family and company hosting plans are in scope. Exact prices, commercial feature limits, trials and any single-event purchase option remain decisions to finalize; do not invent or advertise them as approved.

Navigation and experience

UX-01 Global hierarchy: **My celebrations > Space > Event**. Always make the current space and event clear. Users must understand where their data belongs and how to return to the event list.

UX-02 Use consistent event navigation: **Overview / Plan / Guests / Budget / Vendors / Settings**. Place enabled specialized modules predictably without overwhelming a simple celebration.

UX-03 Create a draft with an event name only. Date, time, location, budget and guest count can be supplied later. Require information when an action genuinely needs it, with a brief explanation.

UX-04 Use readable, generous typography and clearly visible input boxes. Outfit is the selected font trial; preserve the ability to revert. Keep the maroon/gold/ivory identity with a professional, celebration-friendly appearance.

UX-05 Apply uniform spacing, forms, cards, labels, buttons and feedback across student, vendor, event and other pages. Themes may alter event artwork/accents while planning controls remain familiar. Use Figma for design work where appropriate.

UX-06 Keep one clear primary action per form. Provide pending, success and error feedback; label optional fields; preserve entered values on errors; warn before losing unsaved changes. Buttons must perform the action their labels promise.

UX-07 Support mobile layouts, legible text, keyboard navigation, visible focus, meaningful control labels and usable dialogs. Essential actions must not depend on hover.

UX-08 Support upcoming, draft and past/archived events, useful search/filtering and reuse. Empty states should explain the next useful action. Hide unavailable controls or explain their state; never simulate a successful action.

Differentiation to pursue

Family continuity across occasions; easy company-to-family transition; culturally flexible templates; practical coordination of people, requirements and vendors; low-effort guest participation. Validate these through real repeat use rather than assuming feature count proves superiority.

Architecture and migration

ARC-01 Keep the existing Next.js/PostgreSQL application and develop Utsava's next version in stages. Use clearly separated internal modules rather than introducing unnecessary microservices.

Layer	Responsibility
Experience	Responsive web interface, space/event context and consistent navigation.
Identity and access	Authenticated identity, memberships, event roles, guardian links and explicit sharing.
Event domain	Events, functions, template versions, configuration snapshots and lifecycle.
Operations	Guests, tasks/schedule, budgets, services, files and communications.
Commercial	Space subscriptions, entitlements and provider integrations.
Infrastructure	PostgreSQL, private object storage, background jobs, notifications and audit records.

ARC-02 Key relationships: User > Membership > Space; Space > Events; Event > participants/tasks/guests/services/files; Person profile > guardian links; Template version > event configuration; Space > subscription.

ARC-03 Authorize every read and write on the server. Never grant access from a URL role parameter or global admin label alone. Restrict guest/vendor data and use the actual session identity for user overrides.

ARC-04 Use transactional writes and foreign keys for ownership/relationships. Use version checks to reject stale edits. Make retries safe so they do not silently duplicate records or overwrite another user's work.

ARC-05 Preserve academy records and keep existing workflows available while the new foundation is tested. Isolated celebration tables are a temporary migration boundary; consolidate through an explicit adapter/migration, not a permanent pair of disconnected products.

ARC-06 Use the canonical local project at Documents/Projects/Utsav/event-software for edits, Git and localhost. Save changes in version control and test a preview before production. The intended production domain is event.rkldigital.com.

ARC-07 Deploy migrations with the correct production project and verify recovery/rollback behavior. Do not treat a local build or Git push as proof of a successful production deployment.

Acceptance and delivery status

Release acceptance criteria

QA-01 A parent can participate in a company event, host a private birthday, switch spaces and retain company membership without exposing family data.

QA-02 Outsiders, revoked members and viewers cannot modify protected records. Altered IDs/role URLs do not bypass checks. Guests and vendors see only permitted content.

QA-03 Name-only drafts survive refresh; malformed data is rejected; retries/concurrent edits do not cause silent duplication or data loss; templates never overwrite customized events.

QA-04 Test complete birthday and Arangetram journeys, plus a complex wedding/cohost flow. Confirm buttons, module links, filters, forms, imports, exports, relationships and status changes using real persistence.

QA-05 Check desktop/mobile and keyboard flows, authorization regressions, production build, database migration and external provider callbacks. A rendered page or success toast alone does not constitute a pass.

Checkpoint - not a completion claim

Implemented locally: isolated spaces, occasion starters, name-only drafts, basic manual planning sections, membership-checked saves, expiring invitation acceptance for existing verified accounts, safe reuse and archive status. The latest audit repaired simulated permission saving and several navigation defects.

Still incomplete: unified academy/family migration, event-specific roles and guardian integration, invitation onboarding/member management, public RSVP/delivery, structured preparation integration, private attachments, functions/seating/food, Stripe implementation/configuration and production release.

Latest recorded checks: 261 tests passed; TypeScript and production compilation passed; lint had 0 errors and 117 warnings. Main admin routes rendered. This does not certify every role or every workflow.

Decisions and dependencies still open

Stripe credentials and approved plan prices/price IDs; detailed hosting entitlements; storage and delivery service configuration; actual production Vercel project access; complete migration and cross-account acceptance testing. Do not send credentials in this requirements document.

Baseline sources

Approved project conversation through September 13, 2026; docs/celebration-platform-plan.md; docs/architecture-wiring-audit-2026-09-13.md; prior module audit and preparation requirements. Later changes should update this versioned baseline and its acceptance criteria.
